

REDFYRE CENTRAL HEATING COOKER

YOUR TECHNICAL QUESTIONS ANSWERED

What types of fuel can be used to run the Central Heating Cooker?

It can be run on Natural Gas or Kerosene (normal domestic fuel oil).

What style of flue can be used with this model?

A conventional flue only.

Does the cooker need to be situated against an external wall?

Not necessarily. This will depend on the intended location and is best discussed on site with your dealer during the site survey.

Will the floor need reinforcing?

As long as the floor is not suspended there should be no reason to reinforce. However, your Redfyre dealer will confirm this when undertaking a site survey.

Can the Central Heating Cooker supply domestic hot water?

Yes, on all models.

Is the Central Heating Cooker designed for intermittent use?

Both the cooker and the central heating burners can be set on a timer, thus allowing the cooker/ heating to be set to suit your lifestyle. If you require constant heating but only intermittent cooking, or vice versa, the Central Heating Cooker is the most suitable model for you.

How often should my Central Heating Cooker be serviced?

The gas version should be serviced annually whilst the oil version should be every six months.

N.B. Please note it is imperative that your dealer performs a site survey prior to installation. Failure to do so will almost certainly result in impaired long-term performance.
